[[A woman walked in. She sat down]]

▽

$(\Sigma x \in (\Sigma p \in \text{Woman}) \text{WalkedIn}(p))$ **require** $y : \text{Woman}$ **in** $\text{SatDown}(y)$

The meaning of a sentence is a logical proposition.

~~The meaning of a sentence is a logical proposition.~~

~~The meaning of a sentence is a logical proposition.~~

The meaning of a sentence is a type-theoretic expression which may evaluate to a canonical proposition.

~~The meaning of a sentence is a logical proposition.~~

The meaning of a sentence is a type-theoretic expression which may evaluate to a canonical proposition.

~~The meaning of a sentence is a logical proposition.~~

The meaning of a sentence is a type-theoretic expression which may evaluate to a canonical proposition.

What we want:

$(\Sigma x \in (\Sigma p \in \text{Woman}) \text{WalkedIn}(p))$ **require** $y : \text{Woman}$ **in** $\text{SatDown}(y)$

\sim

$(\Sigma x \in (\Sigma p \in \text{Woman}) \text{WalkedIn}(p)) \pi_1(x)$

~~The meaning of a sentence is a logical proposition.~~

The meaning of a sentence is a type-theoretic expression which may evaluate to a canonical proposition.

What we want:

$(\Sigma x \in (\Sigma p \in \text{Woman}) \text{WalkedIn}(p))$ **require** $y : \text{Woman}$ **in** $\text{SatDown}(y)$

\sim

$(\Sigma x \in (\Sigma p \in \text{Woman}) \text{WalkedIn}(p)) \pi_1(x)$

where $M \sim N \stackrel{\text{def}}{=} (M \leq N) \wedge (N \leq M)$

EVERY GRAMMATICAL SENTENCE HAS A MEANING

EVERY GRAMMATICAL SENTENCE HAS A MEANING

...but only some of them denote propositions (types)!

$$\frac{M \in A \quad [M/x] N \Downarrow N'}{\text{require } x : A \text{ in } N \Downarrow N'} \quad (??)$$

$$\frac{M \in A \quad [M/x] N \Downarrow N'}{\text{require } x : A \text{ in } N \Downarrow N'} \quad (??)$$

Can the above be made precise?

$$\frac{M \in A \quad [M/x] N \Downarrow N'}{\text{require } x : A \text{ in } N \Downarrow N'} \quad (??)$$

Can the above be made precise? There are two problems:

$$\frac{M \in A \quad [M/x] N \Downarrow N'}{\text{require } x : A \text{ in } N \Downarrow N'} \quad (??)$$

Can the above be made precise? There are two problems:

1. circularity

$$\frac{M \in A \quad [M/x] N \Downarrow N'}{\text{require } x : A \text{ in } N \Downarrow N'} \quad (??)$$

Can the above be made precise? There are two problems:

1. circularity
2. non-determinism

(HOLD THAT THOUGHT)

A POSITIVE EXAMPLE

[[*The President ran a marathon*]]

[[*The President ran a marathon*]]

▽

require $x : \textit{President}$ **in** $(\Sigma y \in \textit{Marathon}) \textit{Ran}(x; y)$

A POSITIVE EXAMPLE

require $x : \textit{President}$ **in** $(\Sigma y \in \textit{Marathon}) \textit{Ran}(x; y)$

require $x : \textit{President}$ **in** $(\Sigma y \in \textit{Marathon}) \textit{Ran}(x; y)$

\Downarrow

$(\Sigma y \in \textit{Marathon}) \textit{Ran}(\textit{Obama}; y)$

A NEGATIVE EXAMPLE

[[*The unicorn ran a marathon*]]

$\llbracket \textit{The unicorn ran a marathon} \rrbracket$

∇

require $x : \textit{Unicorn}$ **in** $(\Sigma y \in \textit{Marathon}) \textit{Ran}(x; y)$

[[*The unicorn ran a marathon*]]

∇

require $x : \textit{Unicorn}$ **in** $(\Sigma y \in \textit{Marathon}) \textit{Ran}(x; y)$

(not a proposition)

IS require COMPUTATIONALLY EFFECTIVE?

Yes, but we need two things:

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge
2. non-determinism must be eliminated

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge (via forcing)
2. non-determinism must be eliminated

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge (via forcing)
2. non-determinism must be eliminated

$$w \Vdash \mathcal{I}$$

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge (via forcing)
2. non-determinism must be eliminated (via choice sequences)

$$w \Vdash \mathcal{I}$$

Yes, but we need two things:

1. judgments shall be local / sensitive to knowledge (via forcing)
2. non-determinism must be eliminated (via choice sequences)

$$w \Vdash \mathcal{I}_\alpha$$

THE CREATING SUBJECT

All mathematics is a mental construction performed by an idealized subject, subject to the following observations about knowledge:

All mathematics is a mental construction performed by an idealized subject, **subject to the following observations about knowledge:**

All mathematics is a mental construction performed by an idealized subject, subject to the following observations about knowledge:

1. experiences are never forgotten (monotonicity, functoriality)

All mathematics is a mental construction performed by an idealized subject, subject to the following observations about knowledge:

1. experiences are never forgotten (monotonicity, functoriality)
2. at a point in time, the subject knows whether or not it has experienced a judgment (decidability)

All mathematics is a mental construction performed by an idealized subject, **subject to the following observations about knowledge**:

1. experiences are never forgotten (**monotonicity, functoriality**)
2. at a point in time, the subject knows whether or not it has experienced a judgment (**decidability**)

Corollary

The meaning of a judgment \mathcal{J} must be explained in terms of its forcing condition, $w \Vdash \mathcal{J}$, for any stage/world w .

...

2. at a point in time, the subject knows whether or not it has experienced a judgment (decidability)

...

2. at a point in time, the subject knows whether or not it has experienced a judgment (decidability)

Remark

Contra Dummett, I by no means take the above as requiring that the following shall be true in a constructive metatheory, divorced from time:

$$\forall w. \forall \mathcal{J}. (w \Vdash \mathcal{J}) \vee \neg(w \Vdash \mathcal{J}) \quad (\text{Dummett's infelicity})$$

The above is impossible in a Beth model.

logical consequence \Rightarrow semantic consequence

$$w \Vdash \mathcal{I}_2 (\mathcal{I}_1) \iff \forall u \succeq w. u \Vdash \mathcal{I}_1 \Rightarrow u \Vdash \mathcal{I}_2$$

$$\begin{aligned}
 w \Vdash |_x \mathcal{I}(x) &\iff \forall u \geq w. \forall x \in \mathcal{D}_u. u \Vdash \mathcal{I}(x) \\
 w \Vdash \mathcal{I}_2 (\mathcal{I}_1) &\iff \forall u \geq w. u \Vdash \mathcal{I}_1 \Rightarrow u \Vdash \mathcal{I}_2
 \end{aligned}$$

where \mathcal{D}_w is the species of constructions that have been effected by stage w

The meaning of a proposition/type is an intensional (world-indexed) specification of verification acts, i.e. a local meaning explanation for $w \Vdash P \text{ } \textit{verif}$ (and its synthesis).

The meaning of a proposition/type is an intensional (world-indexed) specification of verification acts, i.e. a local meaning explanation for $w \Vdash P \text{ } \textit{verif}$ (and its synthesis).

For a type A , implicit in the explanation of $w \Vdash A \text{ } \textit{verif}$ is a \mathbb{W} -indexed family of PERs $\mathcal{V}[[A]]_w \subseteq \mathcal{D}_w \times \mathcal{D}_w$ whose members **reflect** the computational content (extension) of verification acts.

Truth (**justification**) consists in recognizing the effectiveness of a procedure for **verification**.

Truth (**justification**) consists in recognizing the effectiveness of a procedure for **verification**.

In the model, this corresponds to the inevitability of verification (i.e. a bar, in which verification occurs at all nodes):

$$w \Vdash A \text{ true} \iff \exists \mathfrak{B} \text{ bars } w. \forall u \in \mathfrak{B}. u \Vdash A \text{ verif} \quad (\text{due to Dummett})$$

The analytic judgments of type theory are reflections on mathematical activity.

The analytic judgments of type theory are reflections on mathematical activity.

1. **Canonical membership** reflects **verification**

$$\mathcal{V}[[A]]_w(M, N) \bowtie w \Vdash A \text{ } \textit{verif}$$

The analytic judgments of type theory are reflections on mathematical activity.

1. **Canonical membership** reflects **verification**
2. **Membership** reflects **justification**

$$w \Vdash M = N \in A \not\bowtie w \Vdash A \text{ true}$$

The analytic judgments of type theory are reflections on mathematical activity.

1. **Canonical membership** reflects **verification**
2. **Membership** reflects **justification**
3. **Computation** reflects **the recognition of a bar**

$$w \Vdash M = N \in A \not\bowtie w \Vdash A \text{ true}$$

The analytic judgments of type theory are reflections on mathematical activity.

1. **Canonical membership** reflects **verification**
2. **Membership** reflects **justification**
3. **Computation** reflects **the recognition of a bar**

$$\wedge \left\{ \begin{array}{l} w \Vdash M \Downarrow M' \\ w \Vdash N \Downarrow N' \\ w \Vdash \mathcal{Z} \llbracket A \rrbracket_w (M', N') \end{array} \right\} \bowtie \exists \mathcal{B} \text{ bars } w. \forall u \in \mathcal{B}. u \Vdash A \text{ } \textit{verif}$$

THE require ORACLE: DYNAMICS

choice sequences (streams of objects) may be propounded over time based on the previous experience of the creating subject.

choice sequences (streams of objects) may be propounded over time based on the previous experience of the creating subject.

Example:

$$\alpha(i) = \begin{cases} 0 & i \Vdash A \text{ true} \\ 1 & \neg(i \Vdash A \text{ true}) \end{cases} \quad (\text{KS})$$

Let $\mathcal{K}_A : \mathbf{FinSet}^{\mathbf{Wop}}$ be the sheaf of constructions of A *true* effected “so far” for each canonical proposition A .

Let $\mathcal{K}_A : \mathbf{FinSet}^{\mathbf{Wop}}$ be the sheaf of constructions of A *true* effected “so far” for each canonical proposition A .

We now can give a precise, but non-deterministic, dynamics to **require**:

Let $\mathcal{K}_A : \mathbf{FinSet}^{\mathbf{Wop}}$ be the sheaf of constructions of A *true* effected “so far” for each canonical proposition A .

We now can give a precise, but non-deterministic, dynamics to **require**:

$$\frac{w \Vdash A \Downarrow A' \quad M \in \mathcal{K}_{A'}(w) \quad w \Vdash [M/x] N \Downarrow N'}{w \Vdash \mathbf{require} \ x : A \ \mathbf{in} \ N \Downarrow N'} \quad (*)$$

We need a way to deterministically choose a representative of $\mathcal{K}_A(w)$. First, let κ_A be the choice sequence of lists given by enumerating $\mathcal{K}_A(w)$ at each world w , in order of construction.

We need a way to deterministically choose a representative of $\mathcal{K}_A(w)$. First, let κ_A be the choice sequence of lists given by enumerating $\mathcal{K}_A(w)$ at each world w , in order of construction.

Idea: reformulate Type Theory relative to a choice sequence of “choosers”.

SPREADS: SETS OF CHOICE SEQUENCES

A spread direction \mathfrak{S} is a restriction on choice sequences which is defined by a condition on their finite approximations (prefixes, neighborhoods), subject to the following laws:

SPREADS: SETS OF CHOICE SEQUENCES

A spread direction \mathfrak{S} is a restriction on choice sequences which is defined by a condition on their finite approximations (prefixes, neighborhoods), subject to the following laws:

1. the empty neighborhood shall be admitted

$$\mathfrak{S}(\langle \rangle)$$

SPREADS: SETS OF CHOICE SEQUENCES

A spread direction \mathfrak{S} is a restriction on choice sequences which is defined by a condition on their finite approximations (prefixes, neighborhoods), subject to the following laws:

1. the empty neighborhood shall be admitted

$$\mathfrak{S}(\langle \rangle)$$

2. if a neighborhood is admitted, so shall all its subneighborhoods

$$|_{\vec{u}, m} \mathfrak{S}(\vec{u}) \left(\mathfrak{S}(\vec{u} \smallfrown m) \right)$$

SPREADS: SETS OF CHOICE SEQUENCES

A spread direction \mathfrak{S} is a restriction on choice sequences which is defined by a condition on their finite approximations (prefixes, neighborhoods), subject to the following laws:

1. the empty neighborhood shall be admitted

$$\mathfrak{S}(\langle \rangle)$$

2. if a neighborhood is admitted, so shall all its subneighborhoods

$$\mid_{\vec{u}, m} \mathfrak{S}(\vec{u}) \quad (\mathfrak{S}(\vec{u} \smallfrown m))$$

3. a neighborhood may always be refined within the spread

$$\mid_{\vec{u}} \mathfrak{S}(\vec{u} \smallfrown m) \quad (\mathfrak{S}(\vec{u}))$$

A spread direction for index-choosers:

$$\frac{\overline{\mathfrak{S}(\langle \rangle)}}{\mathfrak{S}(\vec{u}) \mid_n \rho(n) < n \ (n \in \mathbb{N}^+)} \quad \mathfrak{S}(\vec{u} \smallfrown \rho) \quad (\text{spread law})$$

A spread direction for index-choosers:

$$\frac{\overline{\mathfrak{S}(\langle \rangle)}}{\mathfrak{S}(\vec{u})} \quad \frac{\mathfrak{S}(\vec{u}) \quad |_n \rho(n) < n \quad (n \in \mathbb{N}^+)}{\mathfrak{S}(\vec{u} \smallfrown \rho)} \quad (\text{spread law})$$

Deterministic dynamics for **require**:

$$\frac{w \Vdash A \Downarrow_\alpha A' \quad |\mathcal{X}_{A'}(w)| = \ell \quad \text{hd}(\alpha)(\ell) = j \quad w \Vdash [\mathcal{X}_{A'}(j)/x] N \Downarrow_{\text{tl}(\alpha)} N'}{w \Vdash \mathbf{require} \ x : A \text{ in } N \Downarrow_\alpha N'} \quad (\text{for } \alpha \in \mathfrak{S})$$

QUESTIONS?
